I OBJECTIVE (U)

(U) The objective of the work on this task was to provide a data base management facility for the storage and management of technical and administrative data for the psychoenergetic program at SRI International.

1

UNCLASSIFIED

THIS PAGE INTENTIONALLY LEFT BLANK

II TECHNICAL WORK (U)

A. (U) Hardware

(U) The hardware for the Data Base Management System (DBMS) consists
of a Digital Equipment Corporation LSI/23 microcomputer (18-bit addressing)
with 256K of RAM, 30 Mbyte of Winchester hard disk, and 8 RS-232c serial
ports. Connected to these ports are 4 VDTs, a dot matrix printer (120 cps),
and a letter quality printer (30 cps). The system also contains 1 double-
density, double-sided floppy disk drive.

B. (U) Software

(U) The DBMS system software is UNIX Version 7 under software license
from Santa Cruz Operations. The data base management software itself is
INFORMIX Version 3.05 from Relational Database Systems, Inc.

(U) In a relational data base, it is conceptually convenient to think
of the data existing in simple tabular form. Each table and all columns
within that table are assigned unique names. Each row in the table rep-
resents a new set of data. A collection of tables containing related data
is defined as the data base.

(U) How the data are to be distributed among the various tables is
decided during a design phase of the data base creation process. There
are a number of data-dependent guidelines on the optimal techniques to
accomplish this, which have been published in the general DBMS literature.

(U) By linking tables together, it is possible to select any (or all)
rows from as many tables as necessary to satisfy possibly very complex
queries of the data base. It is beyond the scope of this report to describe
in detail the query formulation procedure.

(U) INFORMIX consists of a number of software packages to allow for
the various DBMS activities (shown in Table 1).

3

SECRET

Table 1

(U) DATA BASE ACTIVITY WITHIN INFORMIX

Action	INFORMIX Subprogram
Data base creation	dbbuild
Data base status information	dbstatus
User-friendly data base query	informer
Report generator/formatter	ace
Input/output screen design	perform
C language interface	C-callable procedures

UNCLASSIFIED

(U) The implementation of a DBMS is a 6-step procedure:

- Data base design--logical representation of data

- Implementation of design--create data base

- Debug design--use test data

- User-friendly input design--screen input for nontechnical personnel

- Data input--load data base with all data

- Report design--manipulate data and create.

C. (U) <u>Data Bases</u>

SG1A
(3) RV-Training--administrative details of client personnel training activities.

SG1A

4
3. (U) <u>RV-Training Data Base</u>

(S) The RV-Training Data Base contains the training record of the instructor and three client-supplied students. The data are organized around the training session. For each session, data about the viewer, monitor, target site, session date, and session time are stored. Also, data are maintained for the feedback conditions, the number of observers, the training stage, an indication if redirection was used during the session, and the declared inclemency if any.

(U) The name, coordinates, location, and source information are stored for each site. A given site is also described by an unlimited number of stage attributes, i.e., a site may have a single Stage 1 Phase 1 attribute and a large number of Stage 2 attributes.

(S) Appendix C contains a report on the current training status for Viewers 2, 59, 326, and 743. For each viewer, the report displays

(S)

session and site information as a function of session type and feedback protocol. For example, Viewer 59 had 28 sessions between 9 July 1982 and 21 July 1982 on Stage 1 Phase 1 under Class C conditions. He had no sessions for Stage 1 Phase 1 under Class B conditions. Viewer 2, however, had 92 sessions across a number of stages under Class B conditions.

Next 1 Page(s) In Document Exempt

III DISCUSSION (U)

(U) The examples that are shown in the appendices represent a small
fraction of the data contained for a particular data base. As new data
are added, a new report that reflects the addition can be generated in a
matter of hours. It requires only a day or so to design and test new
reports that display different aspects of the data for the simpler data
bases and correspondingly longer for the more complex ones.
